HIV

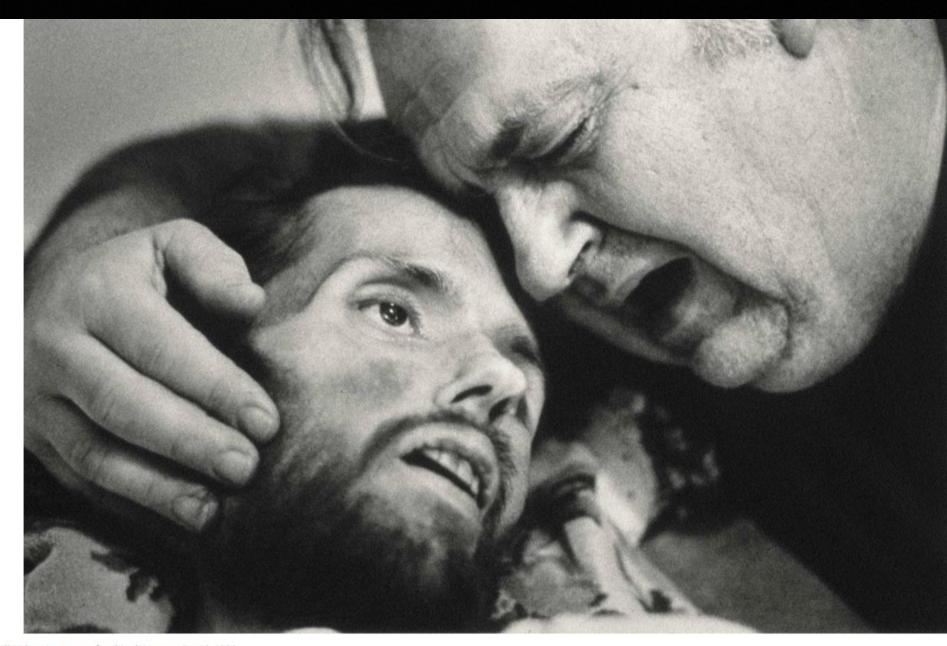

ACOI Board Review 2018 gerald.blackburn@beaumont.org

(No Disclosures)

David Kirby's mother, Kay, holds a photograph of her son -- taken by Ohio photographer Art Smith -- before AIDS took its toll. Therese Frare

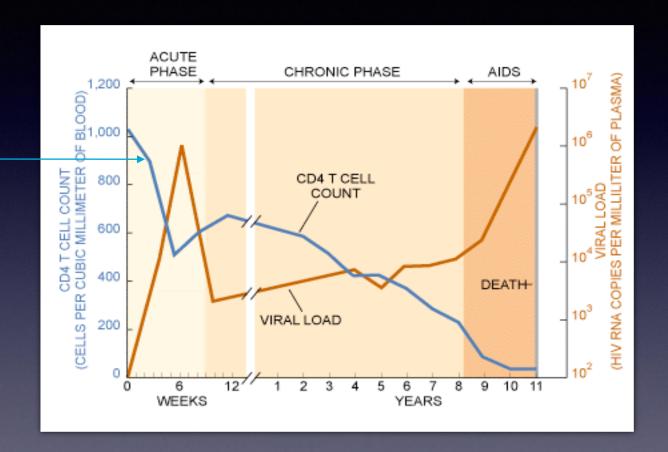

Bill Kirby tries to comfort his dying son, David, 1990. Therese Frare

- 1.1 million HIV + in U.S.; (36.7 million worldwide)
 - 1 in 7 unaware of their HIV +; many others in denial
 - responsible for up to 30% of transmission!
 - < 1/3 completely virally suppressed
- 37,600 newly infected each year in U.S.; over
 1/2 MSM
- 37,000 newly diagnosed each year will present with advanced disease (13,000 will die)

- Over half of HIV+ pts in U.S. are 50 y.o. or older; (by 2030, estimated ~73% will be over 50 y.o.) -> accelerated and/or increased incidence of:
 - CV Dx
 - Diabetes
 - Osteoporosis
 - · COPD
 - Slower immune recovery
 - Malignancies
 - Other dx usually associated w/ aging, including cognitive disorders (or is it the meds?)
 - Drug interactions

HIV

- estimated to have entered the human population ~ 1920
- AIDS first described in U.S. in 1981;
 antibody testing first available 1985
- effective treatment first available in 1996; downside tremendous pill burden, brutal side effects

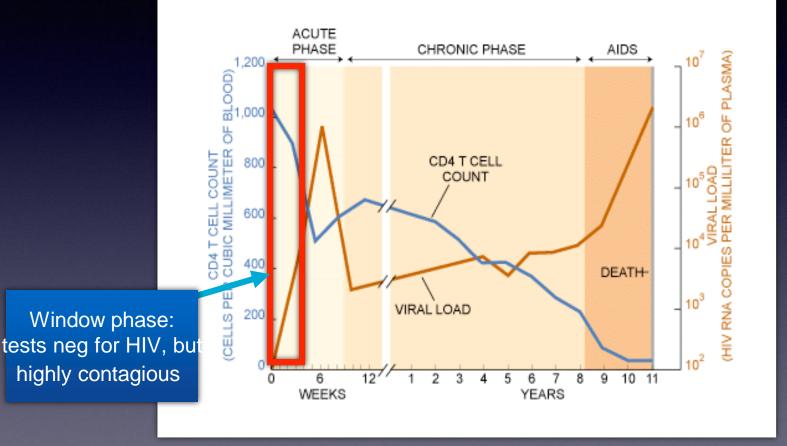

Courtesy: AETC

*irrevocable depletion of CD4 cells in GI tract and other lymphoid tissue -without tx, approx. 10 yrs to develop AIDS -initial presentation may be anywhere along this spectrum

The Acute Retroviral Syndrome

- Non-specific febrile illness often misdiagnosed as "mono" or "aseptic meningitis", occurring 1 - 6 weeks following infection
 - chills, myalgias, adenopathy, maculopapular rash
 - pharyngitis, N/V, diarrhea
 - headache (LP-> mild pleocytosis) "aseptic meningitis"
 - elevated LFT's
- Though HIV ab may be negative or indeterminate, these folks can be highly contagious (if suspected, obtain HIV "Viral Load")
- Spontaneous resolution over next few weeks

Diagnosis

- Screening: EIA antibody (or other rapid tests)
 - Testing now recommended as part of <u>routine</u> medical care (yearly if "high risk"). CDC recs: yearly from ages 13 - 64
 - Newer assays that include p24 antigen (4th generation") may be positive as early as 10 - 14 days after infection
- Confirmation: Western Blot
 - Time to positive: 4 5 weeks
 - Any two: p24, gp41, gp120/160 -> positive
 - one of above bands +, or other + bands -> "indeterminate"
 - if indeterminate, obtain quantitative assay for HIV by PCR - "viral load"

Clues to possible (untreated, advanced) HIV:

- Unusual presentation of a common illness
 - Pneumococcal pneumonia w/ <u>bacteremia</u> in a young person
 - Salmonella, shigella, campylobacter <u>bacteremia</u>
 - Severe or recurrent thrush, vaginal candidiasis
- Presentation of an unusual illness
 - Uncommon dx, e.g. cryptococcal meningitis
 - More advanced/severe dx than expected
 - Unusual age for illness
- TB, especially w/ unusual presentation
- Other STDs

Correlation of CD4 count to presentation of Opportunistic Infections/Malignancies

- Infections common in the non-HIV infected population tend to occur at higher CD4 counts.
 As CD4 counts fall, these same infections may develop, but often with more extensive or disseminated disease. (TB, HSV-1 or 2, H. zoster, candidiasis)
- Infections rarely, if ever, seen in the nonimmunosuppressed host tend to occur at the lowest CD4 counts
 e.g. disseminated CMV (100), MAC (50)
- Certain malignancies more common, even w/ "adequate" CD4 count

AIDS Defining Malignancies

- invasive cervical carcinoma
- Kaposi sarcoma
- systemic non-Hodgkin lymphoma
- primary CNS lymphoma

Non-AIDS Defining Malignancies Increased in HIV + Individuals

- lung
- liver
- kidney
- anus
- head & neck
- skin, including melanoma
- Hodgkin's lymphoma

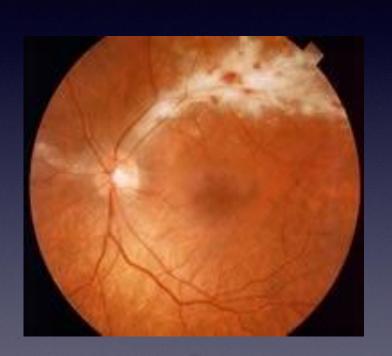

O I's/neoplasms relative to CD4 counts

- 200 500 or above
 - pulmonary TB
 - bacterial pneumonia (pneumococcus most common)
 - H. zoster
 - cervical CA, Kaposi's sarcoma, Hodgkin's lymphoma
 - oral/vaginal candidiasis; anemia; ITP; nephropathy (FSGS)

- < 200
 - PCP
 - Disseminated TB
 - Esophageal candidiasis
 - Cryptococcal meningitis; PML
 - Cryptosporidium
 - Non-Hodgkin's lymphoma
 - Disseminated histoplasmosis, coccidioidmycosis
 - wasting; dementia
- < 100
 - CNS toxo, lymphoma; disseminated CMV,
 MAC (elevated alk. phos)

CMV

Toxo: intensely white focal lesions w/ vitreous inflammation

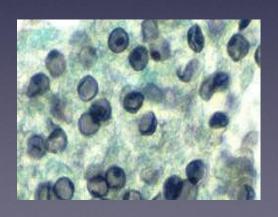

Cryptococcal Meningitis

- Subacute, progressive headache; w/ or w/o fever
- Few to no WBC's in CSF
- + india ink, cryptococcal Ag
- Tx: Amphotericin B +/- flucytosine by fluconazole
- T cell deficiencies

Still Common: PCP (PJP) (P. jirovecii) "YEE ROW VET ZEE"

- Subacute to acute pneumonia - <u>still</u> a common presentation in patients who are unaware of their HIV status or are otherwise untreated
- Diagnosis includes serum for:
 (1 -> 3) beta D Glucan
 (Fungitell ®; Note: also used for invasive candidiasis and aspergillosis)®
- Tx: trimethoprim/sulfa; pentamidine if allergic
- Steroids if pO2 < 70
 <p>(may not apply to HIV neg pts)

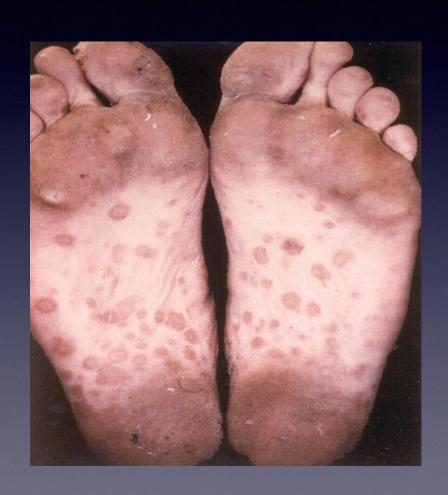

See JAMA: June 24, 2009

Warning:

- Multiple questions regarding trimethoprim/sulfa, including:
 - Side effects:
 - Maculopapular rash
 - Stevens-Johnson syndrome
 - TEN
 - Bone marrow suppression, other blood dyscrasias
 - Hyperkalemia
 - Volume overload w/ IV
 - Treatment of side effects
 - G6PD deficiency

Other Clues: (if one STD, r/o others)

Kaposi's sarcoma (HSV-8) Bacillary Angiomatosis (Bartonella sp.)

CMV Esophagitis (D/D: CMV, HSV, Candida, apthous ulcer)

Hairy Leukoplakia (EBV)

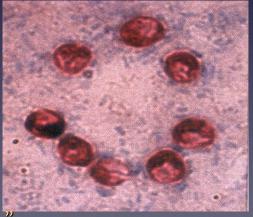

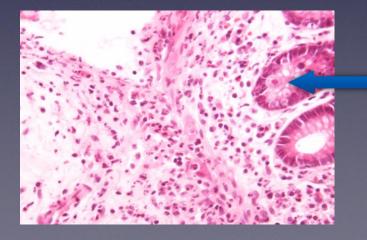

GI Presentations

(Note: Tx will most always emphasize treating underlying HIV)

- Often chronic diarrheal syndrome
 - Cryptosporidiosis no fever; + AFB
 - AFB +
 - Cryptosporidium (3-6 microns)
 - also dx by direct immunofluorescense
 - Rx: ART; ? paromomycin, nitazoxanide
 - Cyclospora (7.5-10 microns)
 - Rx: TMP-SMX
 - Isospora (new: Cystoisospora)
 - Rx: TMP-SMX
 - Mycobacterium Avium-Complex "M.A.C."
 - Rx: Clarithro/Ethambutol/Rifabutin

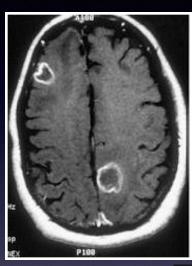

- Other chronic diarrheal syndromes
 - Microsporidia (Enterocytozoon spp.) no fever; bx w/ special stains Rx: Tx HIV, albendazole
 - CMV bloody diarrhea w/ fever; bx Rx: ganciclovir
 - MAC fever, wasting, diffuse abdominal pain;
 culture, +AFB
 azithro or clarithro + ethambutol +/- rifabutin

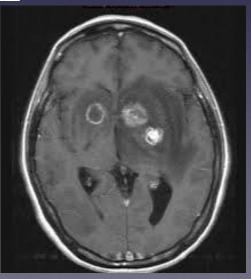

Tx: Ganciclovir

Focal CNS syndromes

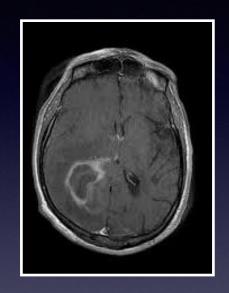

- Toxoplasmosis
 - Acute w/ multiple contrast + lesions w/ + serology (basal ganglia most often)
 - Fever
 - Mass effect

Focal CNS syndromes

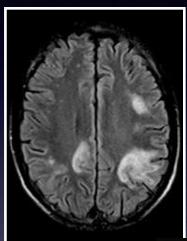

- Lymphoma (Usually diffuse, large B-cell)
 - Subacute presentation
 - Usually single contrast + lesion
 - Mass effect
 - Usually no fever
 - + PCR for EBV (?)

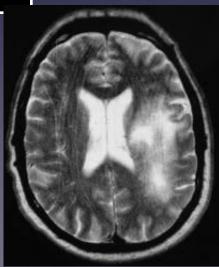

Other Focal CNS syndromes

- PML
 - Multiple, contrast negative lesions of white matter
 - No mass effect
 - No fever
 - + PCR for JC virus

OI Prophylaxis*

PCP	CD4 < 200	TMP-SMX
TB	Previous + PPD** or +PPD > 5mm	INH x 9 mos (and others)
Toxoplasmosis	+ serology w/ CD4 < 100	TMP-SMX
M. avium complex	CD4 < 50	azithromycin or clarithromycin

^{*}can usually be d/c'd upon return of CD4 count to above threshold parameters after ~3 months

**QFG assays similar to PPDs, but also w/ it's own difficulties in interpretation

Clinical Course

Viral load:

- Correlates with degree of contagiousness, rate of immune deterioration (as reflected in CD4 ct)
- "Cumulative viremia" w/ its resultant persistent inflammation and stimulation of the immune system may be responsible for many of the long term complications of HIV, e.g.,
 - Increased risk of CV and other diseases usually associated w/ aging
 - Increased risk of malignancy (including non-AIDS defining malignancies)

Clinical Course

- CD4 lymphocyte count (not the entire story):
 - Reflects immune status (as affected by VL)
 - Correlates w/ development of opportunistic infections (OI's)
 - Correlates to some extent w/ risk of malignancies, particularly if very low CD4 count prior to treatment
 - 27% of HIV-related deaths due to HIV-related malignancies
 - Risk of NHL > 76 times that of non-HIV infected individual
 - Restoration may approach normalcy, but probably never completely

Who/When to Treat? (HHS Guidelines - Oct. 17, 2017)

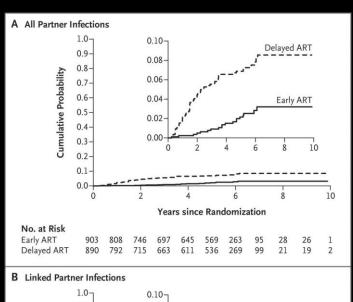

Offer to all upon diagnosis, including same day Rx

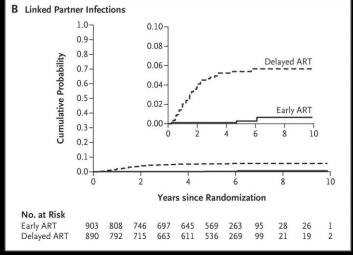

Benefits of Early Treatment

- Decrease in transmission (undetectable viremia minimizes risk of transmission)
- Decrease in illnesses associated w/ impaired immune system e.g. various infections, cancers
- Decrease in illnesses associated w/ chronic inflammation/accelerated aging e.g. heart disease, cancer

"Treatment as Prevention (of transmission)"

"No linked infections were observed when HIV-1 infection was stably suppressed by ART in the index participant"

Initiation of Antiretroviral Therapy in Early Asymptomatic HIV Infection

The INSIGHT START Study Group - N Engl J Med 2015; 373:797-807

- 4685 HIV + patients
 - median VL of 12,759 copies/ml
 - median CD4 count of 651
- After 3 years, those started immediately on ART experienced less than half of serious AIDS-related events (including reduced cancer risk by 64%) than those whose therapy was deferred to later

HIV and Pregnancy

- Overall risk of transmission if infected mother not identified (and not on tx): 25-33%
- IF infected mother identified (and appropriately treated): 1-3% or less
- Test at initial visit and at near term.
 Treat if positive

Treatment

At least three drugs from at least two different classes of anti-retrovirals

Usually two NRTIs (nucleoside reverse transcriptase inhibitor)

plus either a

NNRTI

or a

Pl/r (ritonavir "boosted" protease inhibitor)

or a

InSTI (integrase inhibitor)

Initial RX of Treatment-Naïve Patients HHS Guidlines, Oct. 2017

Integrase inhibitor based:

- Dolutegravir (Tivicay®) + abacavir/lamivudine = Triumeq® -ONLY for pts who are HLA-B*5701 negative or....
- Dolutegravir + [Emtricitabine/tenofovir (Truvada®)] or....
- Elvitegravir/cobistat + [Emtricitabine/tenofovir (Truvada®) / Descovyy®] = Stribild® / Genvoya® or....
- Raltegravir (Isentress®) + [Emtricitabine/tenofovir (Truvada®)]

Note: Other sources have more extensive lists of acceptable options; certain two drug Rx's may be acceptable for long term suppression

Coinfection w/ Hepatitis B/C

With hepatitis B:

Include combination of emtricitabine or lamivudine + tenofovir whenever possible, as these have dual activity for treating both infections

- Discontinuation may lead to serious liver damage from reactivation of Hepatitis B
- With hepatitis C:

most treat hepatitis C before initiating rx for HIV unless CD4 < 200

Possible ?'s:

- Hypersensitivity rxn to abacavir (Ziagen ®) if + for HLA-B*5701 (more common in caucasians).
 DO NOT RX;
 if prior reaction, DO NOT RE-CHALLENGE!!!
- Renal insufficiency, bone resorption w/ tenofovir (Viread ®) (or Truvada ® as combination Rx)
- Jaundice (indirect hyperbilirubinemia) w/ atazanivir (Reyataz ®)

Immune Reconstitution Inflammatory Syndrome ("IRIS")

- An exaggerated inflammatory response to a previously relatively quiescent condition as a result of restoration of immune competence following initiation of HAART
 - Focal MAC
 - CMV vitreitis
 - TB
 - Cryptococcal meningitis
 - Hepatitis C
 - PML, HSV
- Rx: add anti-inflammatories and continue ART

Prevention:

- "Treatment as Prevention" both of infection and complications of same
- Pre-exposure Prophylaxis ("PrEP"):
 - Once daily Truvada ®
 - Controversial, expensive, but effective if taken as rx'd
 - (Select) long term discordant sexual partners.
 Probably not necessary if partner undetectable VL
 - Commercial sex workers
 - but.....among MSM using PrEP:
 - 25.3 increased incidence of N. gonorrhea!
 - 11.2 increased incidence of chlamydia!
 - 44.6increased incidence of syphillis!!!

Prevention:

- Post-exposure Prophylaxis ("PEP")
 - Occupational: Effective
 - Non-occupational ("nPEP"): at least partially effective
 - ~72 hr window for Rx
- Condoms; Circumcision

Potential?'s

Acute Retroviral Syndrome IRIS

Adverse Rxns to TMX/Sulfa

Presentations of HIV

Correlation of CD4 count w/ opportunistic infection

Histology of renal disease in HIV+ individuals: FSGS

Prophylaxis/Rx of Ol's, e.g.:

Steroids in the treatment of PJP

Immune deficiency associated w/ Cryptococcal infections

TB prophylaxis / PPD skin test
