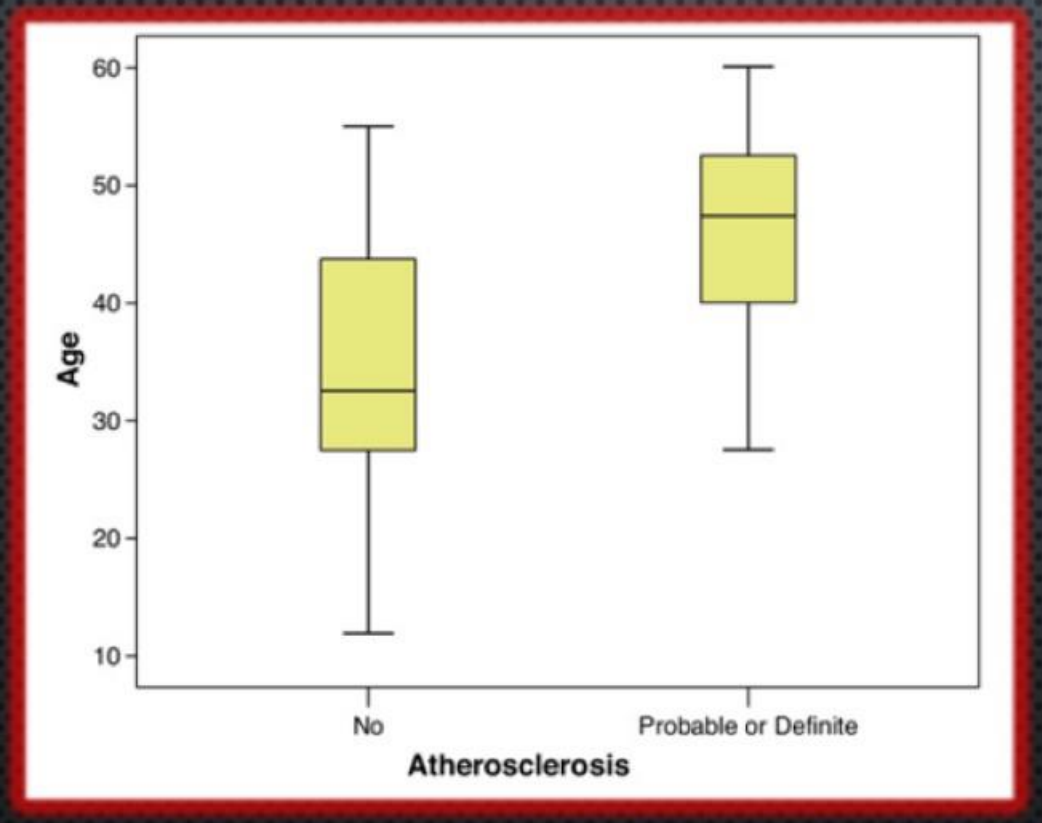
ASCVD RISK REDUCTION THERAPY: BEYOND STATINS



Age at Death of Mummies With and Without Atherosclerosis

Princess

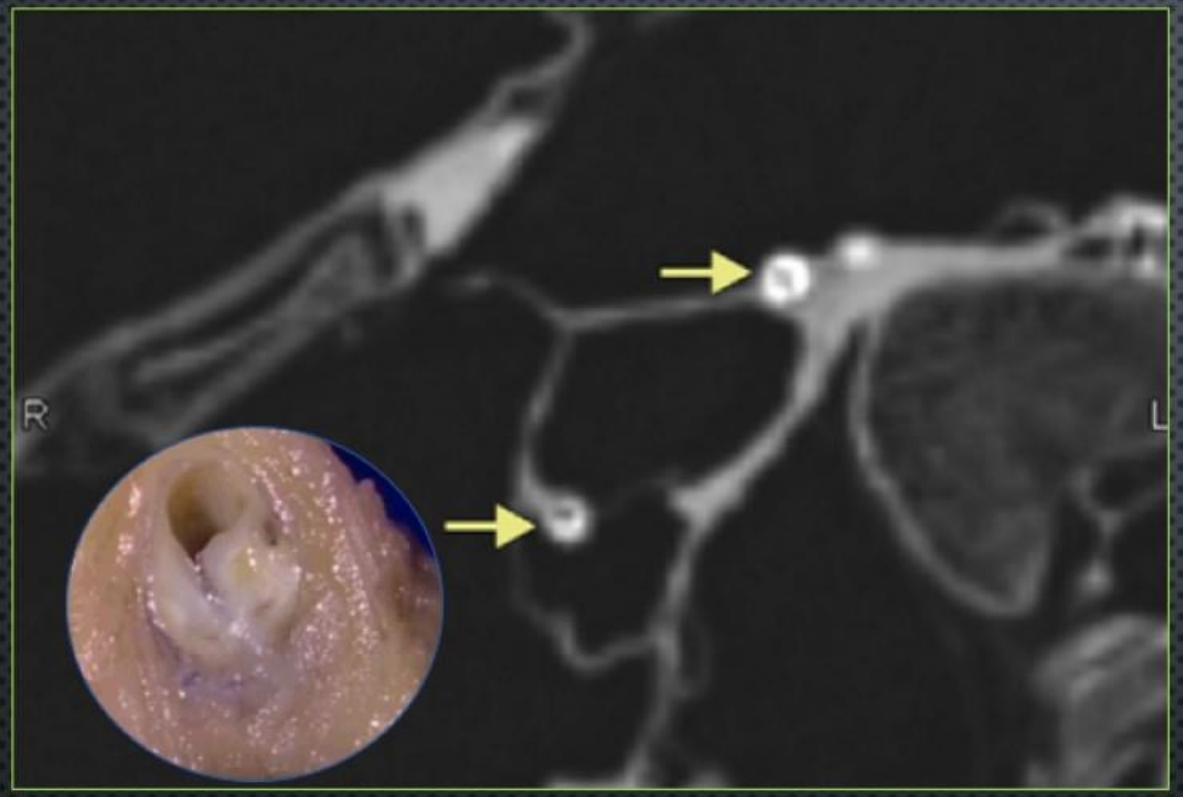
Chilton

OBJECTIVES

1. Recognize the interrelationship of insulin resistance to atherosclerosis
2. Importance of genetic influence on hypertension

3. Increasing risk of atherosclerosis by duration of high lipids
4. Amplification of CV risk with hypertension and lipids

5. New guidelines
    a. BP
    b. Lipids



Calcifications in the left and right coronary arteries (arrows) in the mummy

Extensive calcifications along the course of the superficial femoral arteries in the mummy of a man who lived during the 18th Dynasty

WHAT PERCENTAGE YOUNG ASYMPTOMATIC 30-40 YEAR OLD PEOPLE HAVE ATHEROSCLEROSIS?

1. 10%
2. 40%
3. 50%
4. 60%
5. >70%

No diabetes

Answer 5 > 70%

Atherosclerosis starts early

High Prevalence of Coronary Atherosclerosis in Asymptomatic Teenagers and Young Adults

Evidence From Intravascular Ultrasound

E. Murat Tuzcu, MD; Samir R. Kapadia, MD; Eralp Tutar, MD; Khaled M. Ziada, MD; Robert E. Hobbs, MD; Patrick M. McCarthy, MD; James B. Young, MD; Steven E. Nissen, MD

Background—Most of our knowledge about atherosclerosis at young ages is derived from necropsy studies, which have inherent limitations. Detailed, in vivo data on atherosclerosis in young individuals are limited. Intravascular ultrasonography provides a unique opportunity for in vivo characterization of early atherosclerosis in a clinically relevant context.

Methods and Results—Intravascular ultrasound was performed in 262 heart transplant recipients 30.9±13.2 days after transplantation to investigate coronary arteries in young asymptomatic subjects. The donor population consisted of 146 men and 116 women (mean age of 33.4±13.2 years). Extensive imaging of all possible (including distal) coronary segments was performed. Sites with the greatest and least intimal thickness in each CASS segment were measured in multiple coronary arteries. Sites with intimal thickness ≥0.5 mm were defined as atherosclerotic. A total of 2014 sites within 1477 segments in 574 coronary arteries (2.2 arteries per person) were analyzed. An atherosclerotic lesion was present in 136 patients, or 51.9%. The prevalence of atherosclerosis varied from 17% in individuals <20 years old to 85% in subjects ≥50 years old. In subjects with atherosclerosis, intimal thickness and area stenosis averaged 1.08±0.48 mm and 32.7±15.9%, respectively. For all age groups, the average intimal thickness was greater in men than women, although the prevalence of atherosclerosis was similar (52% in men and 51.7% in women).

Conclusions—This study demonstrates that coronary atherosclerosis begins at a young age and that lesions are present in 1 of 6 teenagers. These findings suggest the need for intensive efforts at coronary disease prevention in young adults.

Closing highlights

2017 UPDATE

Higher-risk patients with clinical ASCVD: age >65 years, prior MI or non-hemorrhagic stroke, current daily cigarette smoking, symptomatic PAD with prior MI or stroke, history of non-MI related coronary revascularization, residual coronary artery disease with >40% stenosis in >2 large vessels, HDL-C <40 mg/dL for men and <50 mg/dL for women, hs-CRP >2 mg/L, or metabolic syndrome

JACC 2017;70:1785 guidelines

GUIDELINES-2017 (NON STATIN OR ADDITIONAL LOWERING)

IMPROVE-IT (EZETIMIDE)

Patients who require <25% additional lowering of LDL-C, patients with recent ACS <3 months, cost considerations with recent availability of generic ezetimibe and future cost savings, ease of use as oral agent with low pill burden, patient preferences, heart failure, hypertension, age >75 years, diabetes, stroke, CABG, PAD, eGFR <60 ml/min/1.73 m2, and smoking.

PCSK-9 inhibitor

Clinical ASCVD and comorbidities require >25% additional lowering of LDL-C, a PCSK9 inhibitor may be preferred as the initial non-statin agent. The clinician–patient discussion should consider the extent of available scientific evidence for net ASCVD risk- reduction benefit, cost, administration by subcutaneous injection, every 14-day or monthly dosing schedule, and storage requirements **(refrigeration).**

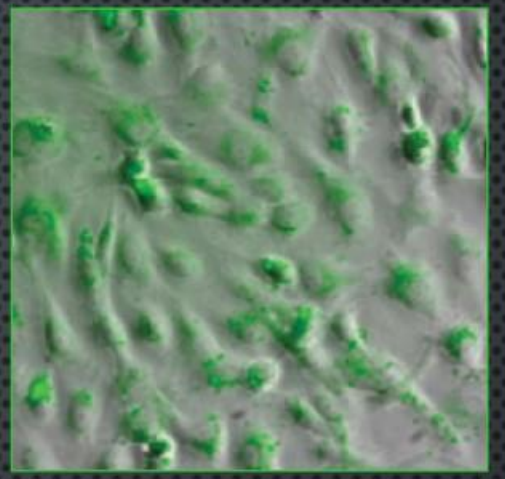
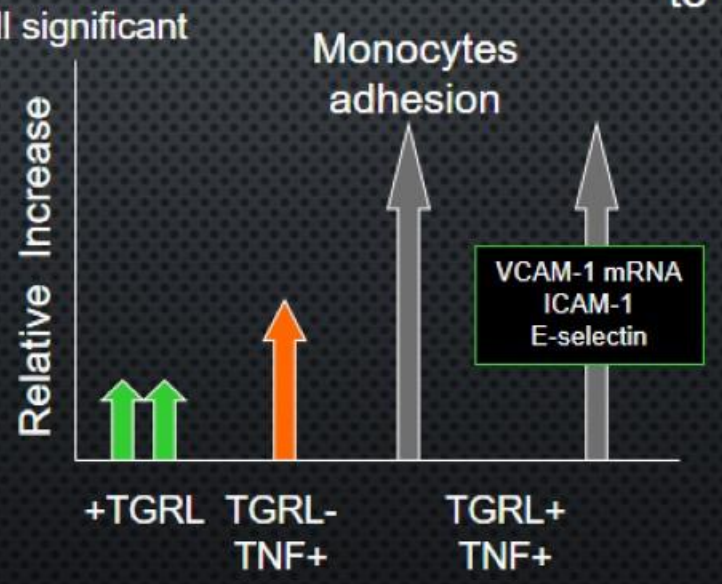
PRIMING VASCULAR ENDOTHELIAL CELLS FOR ENHANCED INFLAMMATORY RESPONSE



TGRL electron transfer-based fluorescence bound to HAECs treated for 2hrs

- TGRL ALONE NO INFLAMMATION IN HAEC
- TGRL ENHANCED INFLAMMATORY RESPONSE 10X TO CYTOKINE STIMULATION



HAECs were repetitively incubated with dietary levels of freshly isolated TGRL for 2 hours per day for 1 to 3 days to mimic postprandial lipidemia.
