

Learning the Asthma Guidelines by Case Studies

Timothy Craig, DO

Professor of Medicine and Pediatrics

Distinguished Educator

Penn State University

Hershey Medical Center

Objectives

- 1. Learn the Asthma Guidelines
- 2. Be able to classify asthma severity
- 3. Be able to determine asthma control
- 4. Be able to successfully treat asthma
- 5. Be able to improve patient outcomes
- 6. Pass your boards

- 19 yo male with asthma since age 5
- Presents with EIB and year round nasal congestion
- Denies daytime symptoms
- Night time symptoms 2 times per month
- Uses albuterol pre-exercise only
- He has moderate limitation on ability to exercise despite albuterol
- No ER visits or Hospitalizations
- What is his asthma severity?
- What would you do now?

- What is his asthma severity?
 - a. Mild intermittent asthma
 - b. Mild persistent asthma
 - c. Moderate persistent asthma
 - d. Severe persistent asthma

Ans:

- What is his asthma severity?
 - a. Mild intermittent asthma
 - b. Mild persistent asthma
 - c. Moderate persistent asthma
 - d. Severe persistent asthma

Ans: C

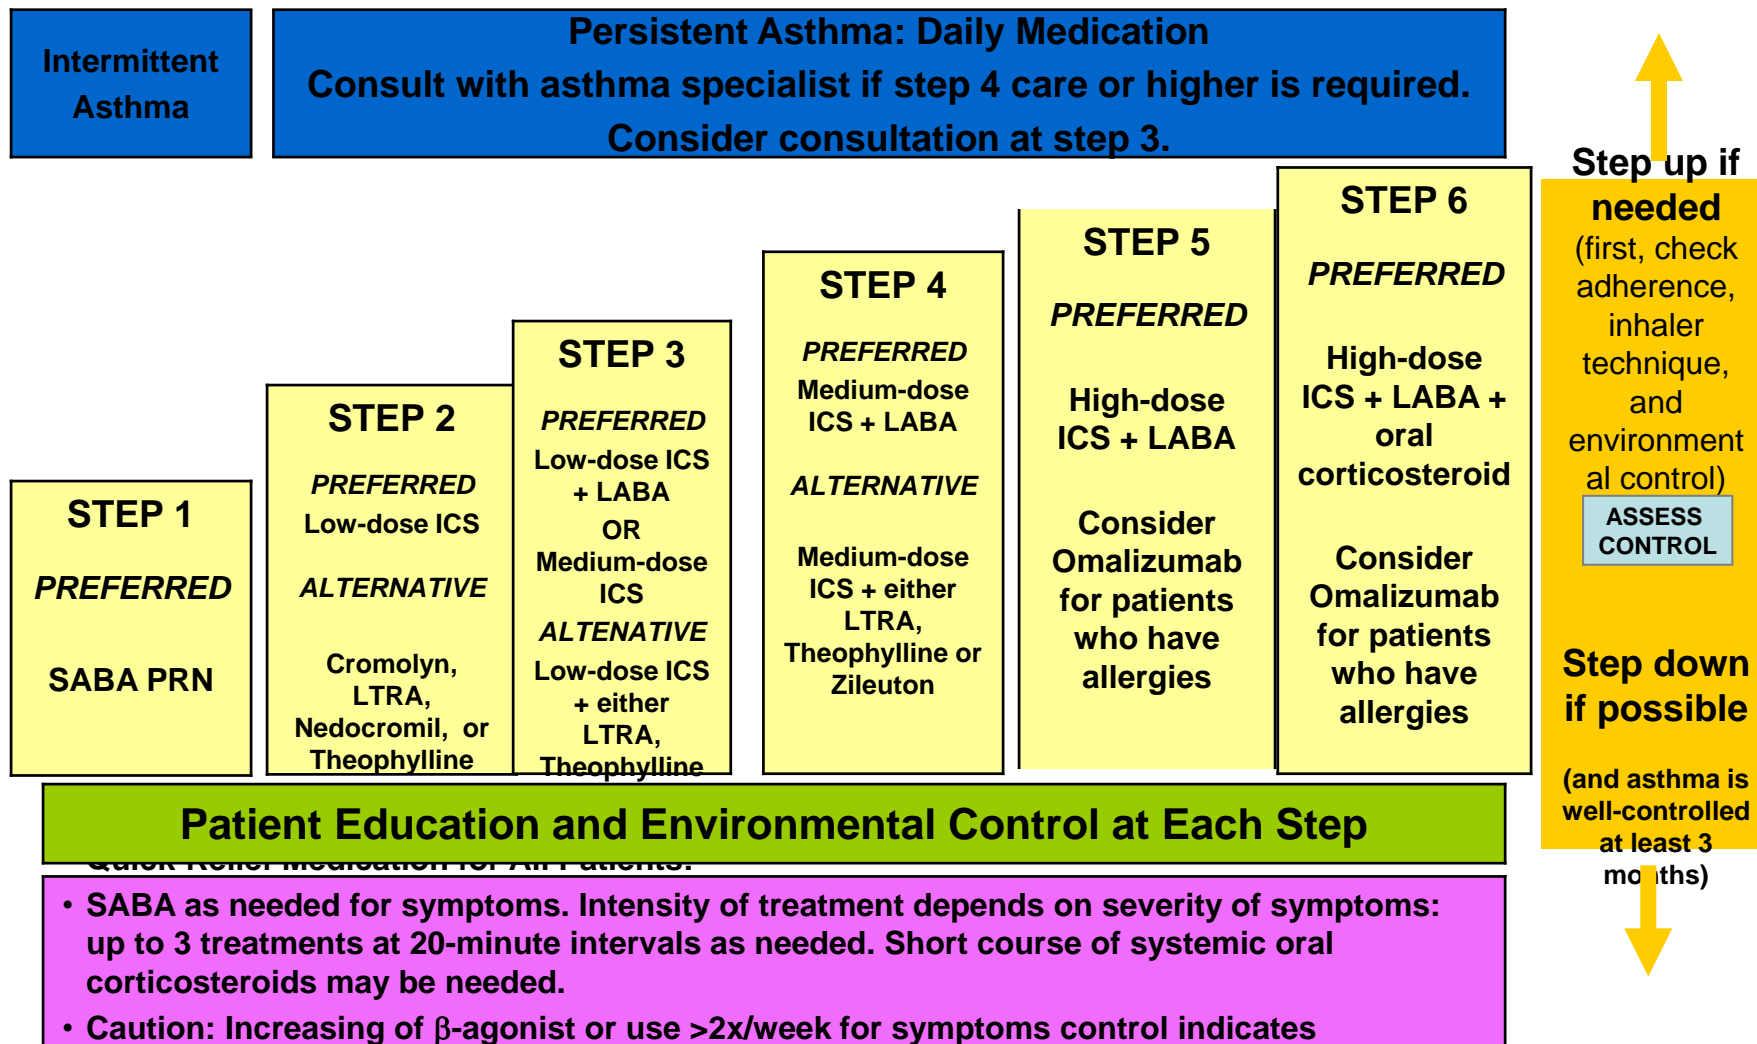

- What would you do now?
 - a. Start a LABA
 - b. Start a low dose ICS
 - c. Start a high dose of ICS with LABA
 - d. Start a low dose of ICS with a LABA

Ans:

- What would you do now?
 - a. Start a LABA
 - b. Start a low dose ICS
 - c. Start a high dose of ICS with a LABA
 - d. Start a low dose of ICS with a LABA

Ans: D

Stepwise Approach for Managing Asthma in Patients ≥ 12 Years of Age

- FVC was 90%, FEV-1 was 80% and his ratio was 85%
- CXR was normal
- Skin tests were positive for house dust mites
- Prescribed a low dose of inhaled steroid and a LABA
- Started on nasal steroid
- Albuterol as needed
- Prednisone for severe asthma
- Educated on technique, adherence, acute asthma action plan and mite avoidance

- Returns in 3 month
- He has been using his ICS and LABA regularly
- Denies nighttime, daytime symptoms, or exercise related symptoms
- His QOL is good.
- Albuterol in the last week has been pre-exercise only.
- He used prednisone three times for asthma attacks over the past 12 weeks
- FEV-1 was 80% with a ratio of 83%
- What is his asthma control?
- What would you do?

- What is his asthma control?
 - A. Moderate persistent asthma
 - B. Well controlled asthma
 - C. Not well controlled asthma
 - D. Very poorly controlled

Ans:

- What is his asthma control?
 - A. Moderate persistent asthma
 - B. Well controlled asthma
 - C. Not well controlled asthma
 - D. Very poorly controlled

Ans: D

Assessing Asthma Control in Patients ≥ 12 Years of Age

| Components of Severity | | Classification of Asthma Control (Youths ≥ 12 years of age & adults) | | |
|------------------------|---|--|--------------------------------|----------------------------------|
| | | Well Controlled | Not Well Controlled | Very Poorly Controlled |
| Impairment | Symptoms | ≤ 2 days/week | > 2 days/week | Throughout the day |
| | Nighttime awakenings | ≤ 2 /month | 1-3x/week | ≥ 4 x/week |
| | Interference with normal activity | None | Some limitation | Extremely limited |
| | Short-acting beta ₂ -agonist use for symptom control | ≤ 2 days/week | > 2 days/week | Several times per day |
| | FEV ₁ or peak flow | $> 80\%$ predicted/personal best | 60-80% predicted/personal best | $< 60\%$ predicted/personal best |
| | Validated questionnaires* ATAQ ACQ ACT | 0 ≤ 0.75 ≥ 20 | 1-2 ≥ 1.5 16-19 | 3-4 N/A ≤ 15 |
| Risk | Exacerbations | 0-1/year | ≥ 2 /per year | ≥ 2 /per year |
| | Progressive loss of lung function | Evaluation requires long-term follow-up care. | | |
| | Treatment-related adverse effects | | | |

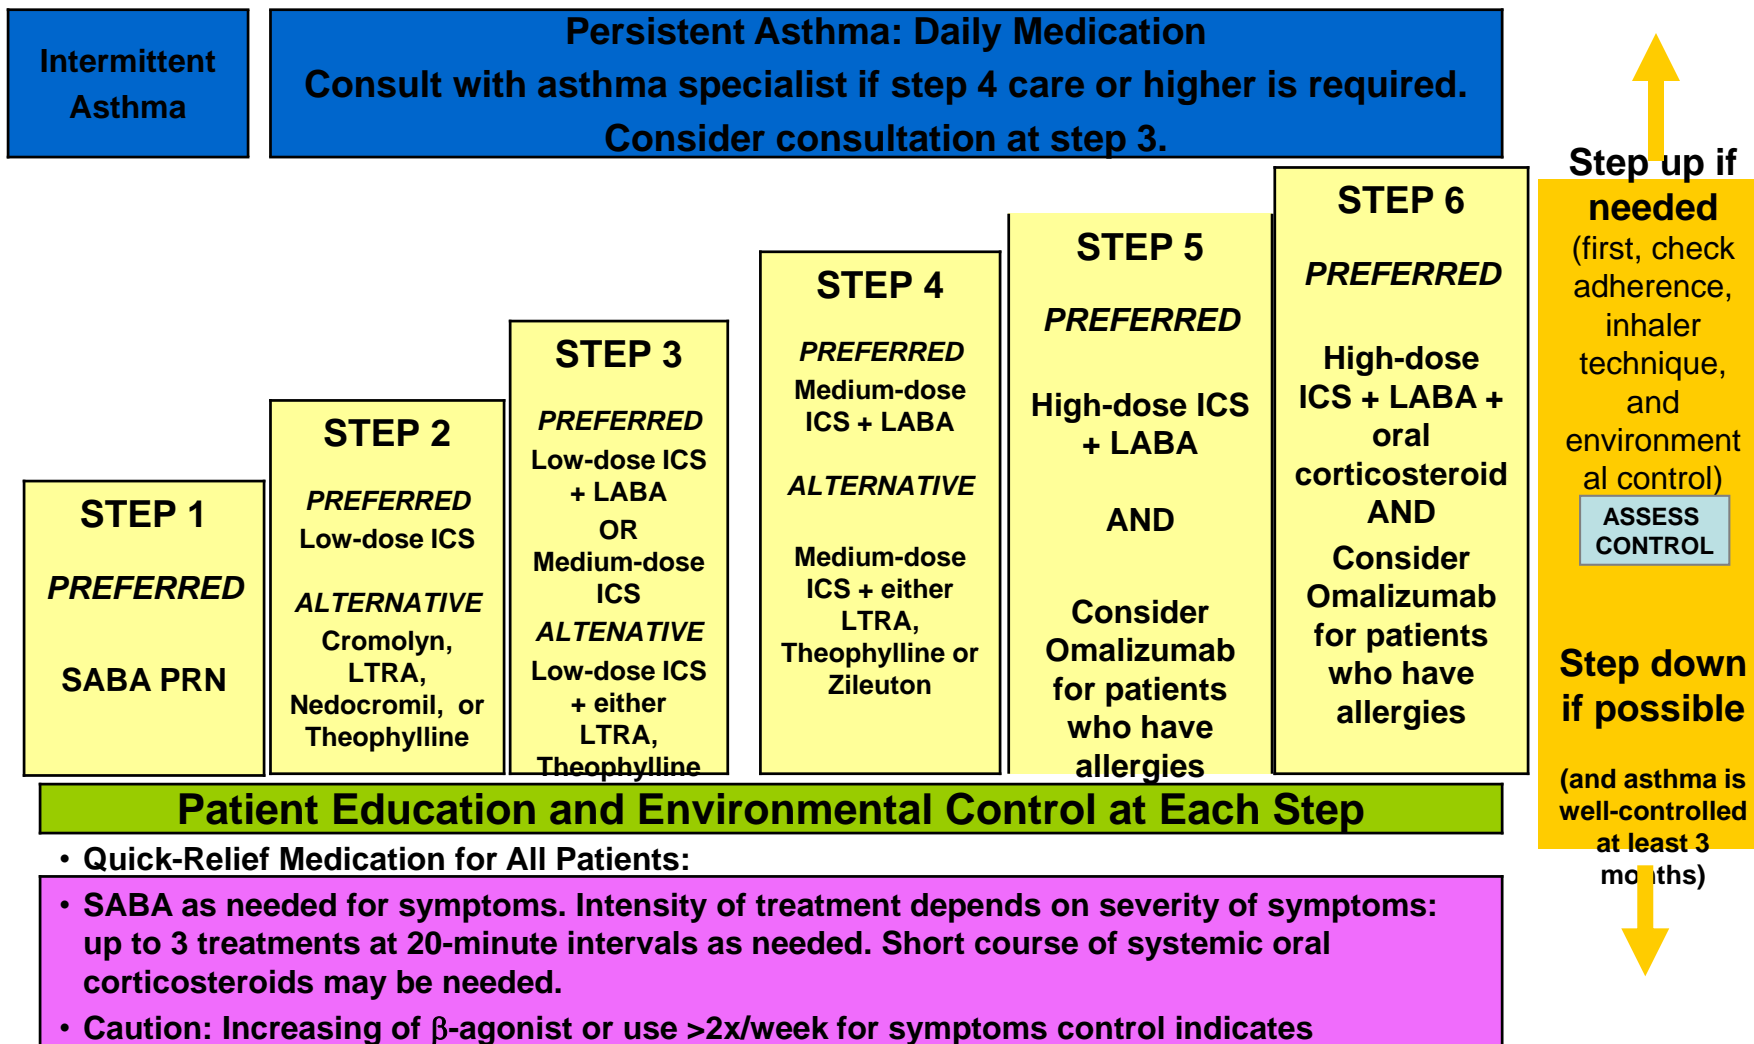

- What would you do?
 - a. Add mepolizumab
 - b. Increase ICS to a high dose and continue the LABA
 - c. Add a short acting anticholinergic
 - d. Add zileutin (a lipo-oxygenase inhibitor)
 - e. Add omalizumab

Ans:

- What would you do?
 - a. Add mepolizumab
 - b. Increase ICS to a high dose and continue the LABA
 - c. Add a short acting anticholinergic
 - d. Add zileutin (a lipo-oxygenase inhibitor)
 - e. Add omalizumab

Stepwise Approach for Managing Asthma in Patients ≥ 12 Years of Age

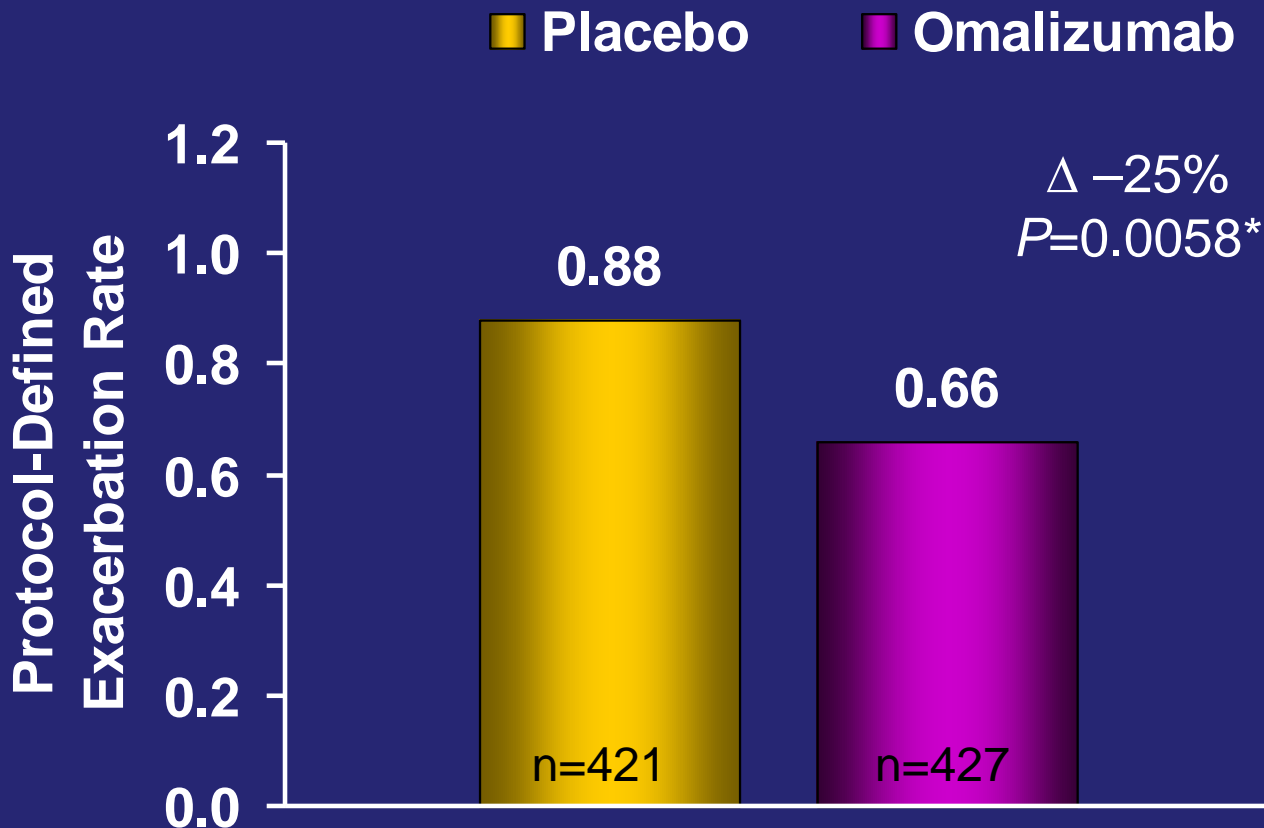

inadequate control and the need to step up treatment.

NHLBI. National Asthma Education and Prevention Program. Expert Panel Report 3. Available at:

<http://www.nhlbi.nih.gov/guidelines/asthma/asthgdln.pdf>. Accessed 8.30.07.

- Prescribe a peak flow meter
- High dose inhaled corticosteroid plus LABA
- Consider omalizumab or mepolizumab
- SABA PRN and pre-exercise
- Increase albuterol for yellow zone
- Prednisone for red zone
- F/U in 1 month

Primary Endpoint: Rate of Asthma Exacerbations Over 48 Weeks

*Poisson regression including terms for treatment, concomitant asthma medication strata, dosing regimen, and number of exacerbations in the prior year.

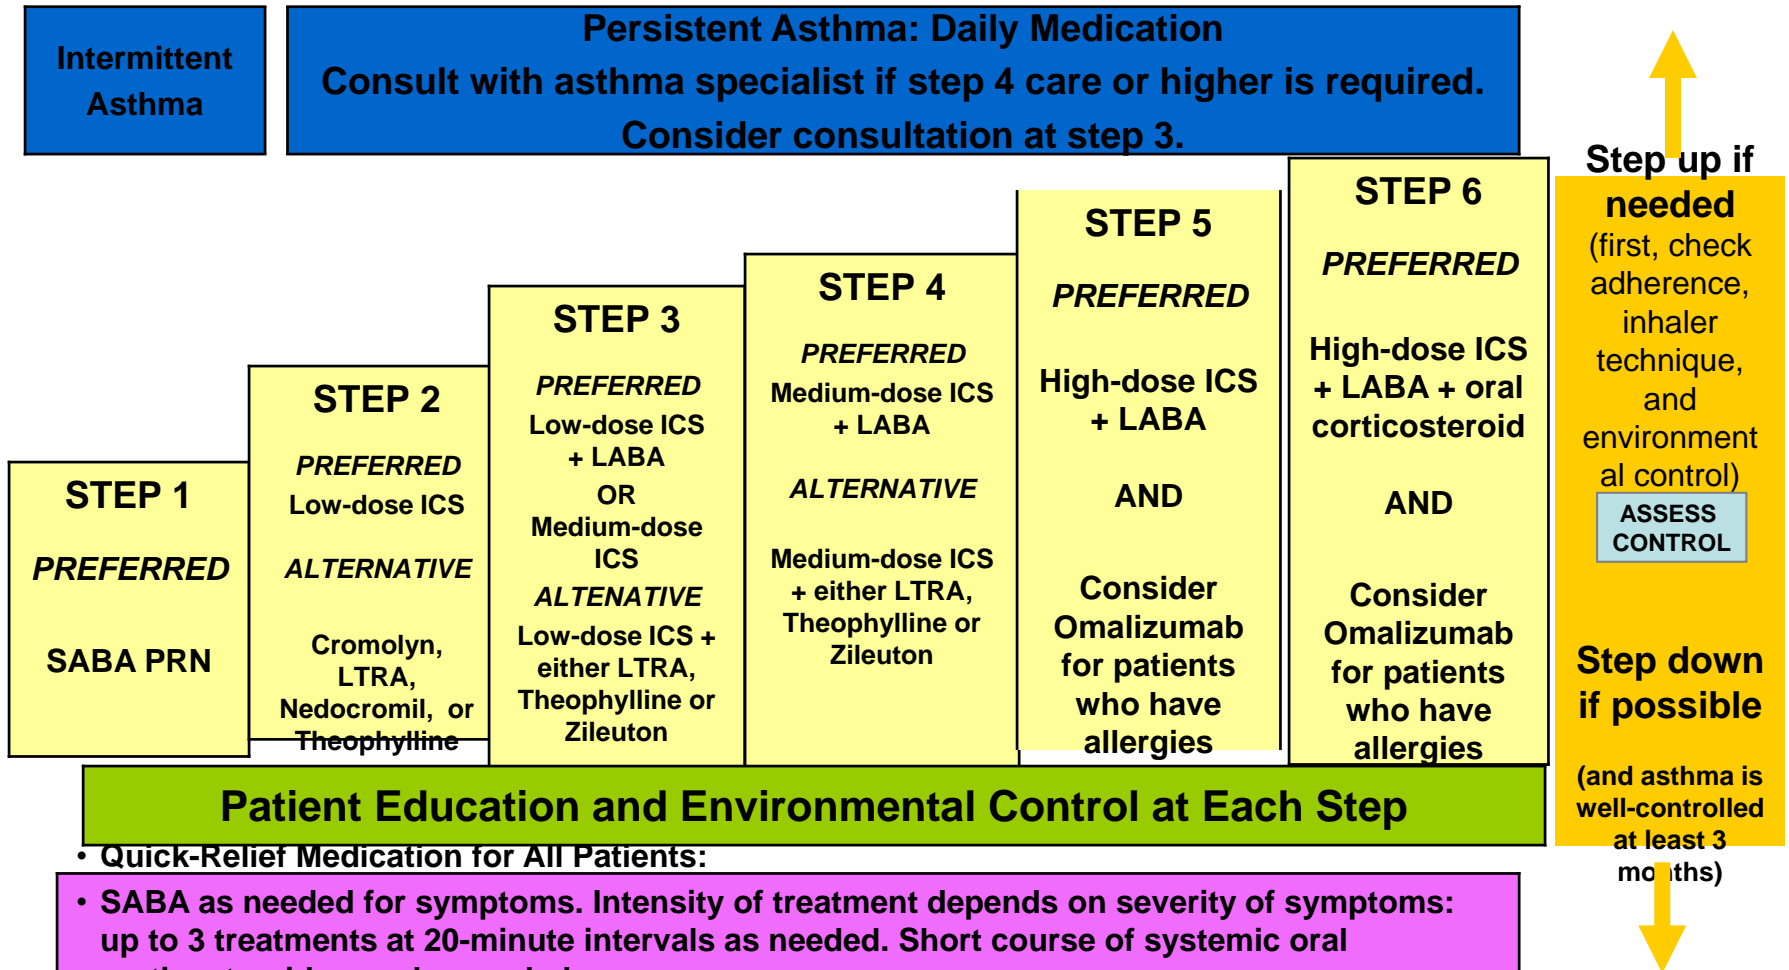

Exacerbations comparing mepolizumab to placebo

Halder, et al. NEJM 2009; 360:973-984.

Review the Guidelines

Stepwise Approach for Managing Asthma in Patients ≥ 12 Years of Age

Patient Education and Environmental Control at Each Step

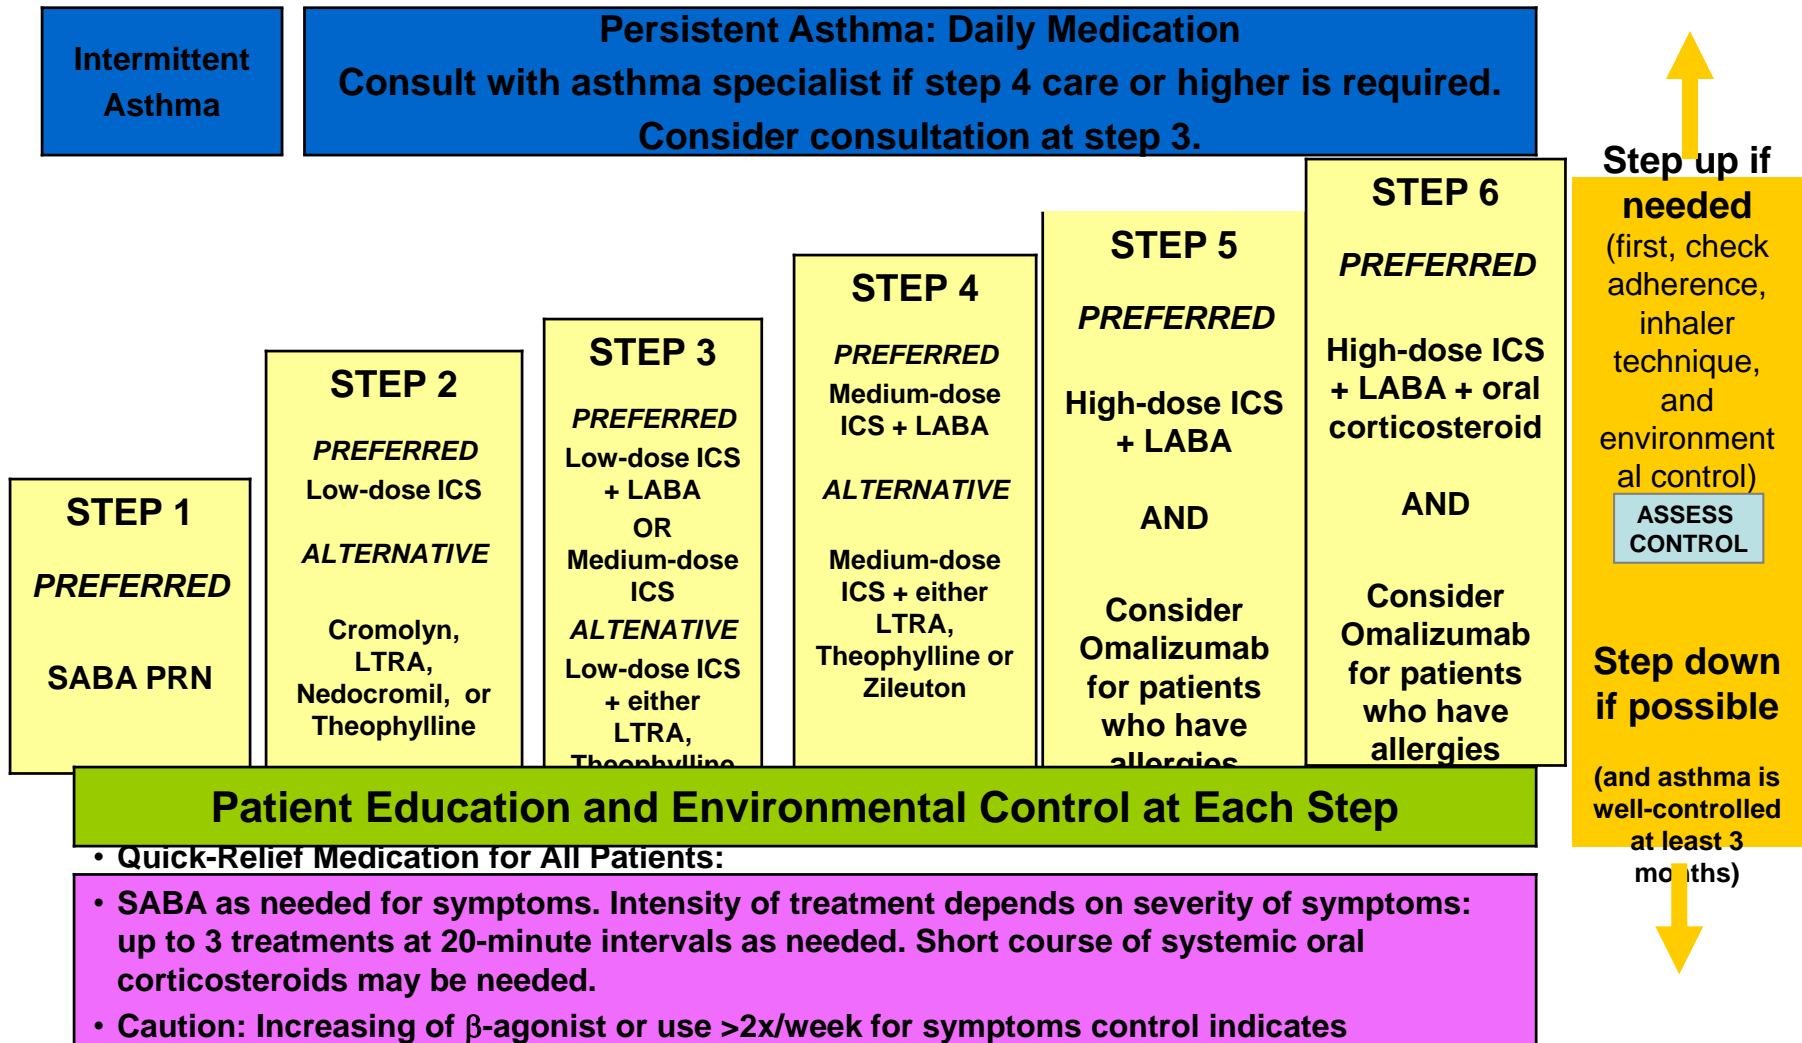

- Quick-Relief Medication for All Patients:
- SABA as needed for symptoms. Intensity of treatment depends on severity of symptoms: up to 3 treatments at 20-minute intervals as needed. Short course of systemic oral corticosteroids may be needed.
- Caution: Increasing of β -agonist or use $>2x/week$ for symptoms control indicates

inadequate control and the need to step up treatment.
 NHLBI. National Asthma Education and Prevention Program. Expert Panel Report 3. Available at: <http://www.nhlbi.nih.gov/guidelines/asthma/asthgdln.pdf>. Accessed 8.30.07.

New developments that have been published since the guidelines have been published:

- 1. Tiotropium Bromide can be added in place of a LABA to a moderate to high dose of ICS if the patient is not controlled or to a ICS/LABA combination for poor control
- 2. Ipratropium bromide can be used in the ED when albuterol use is maximized and patient still has symptoms. This may decrease risk for hospitalization.
- 3. Mepolizumab is approved for severe asthma and inhibits IL-5 and decreases influx of eosinophils into the airway and decrease exacerbations.
- 4. Omalizumab decreases exacerbations and is now approved to use in child.

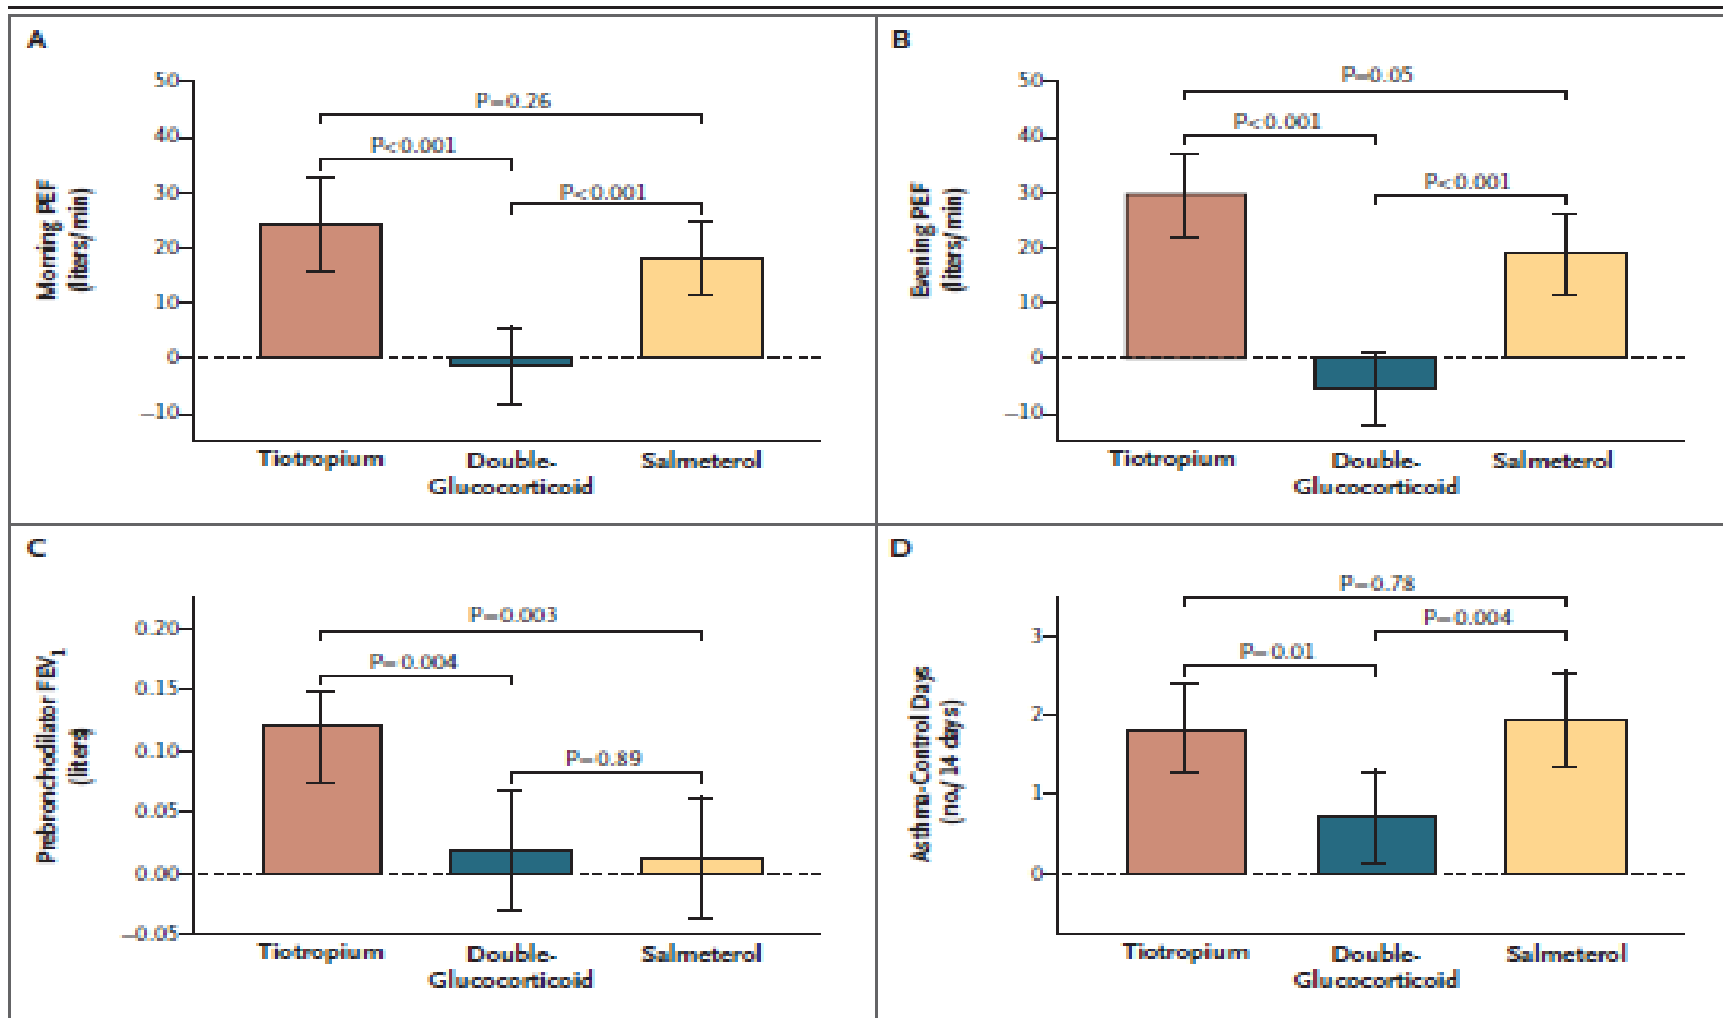

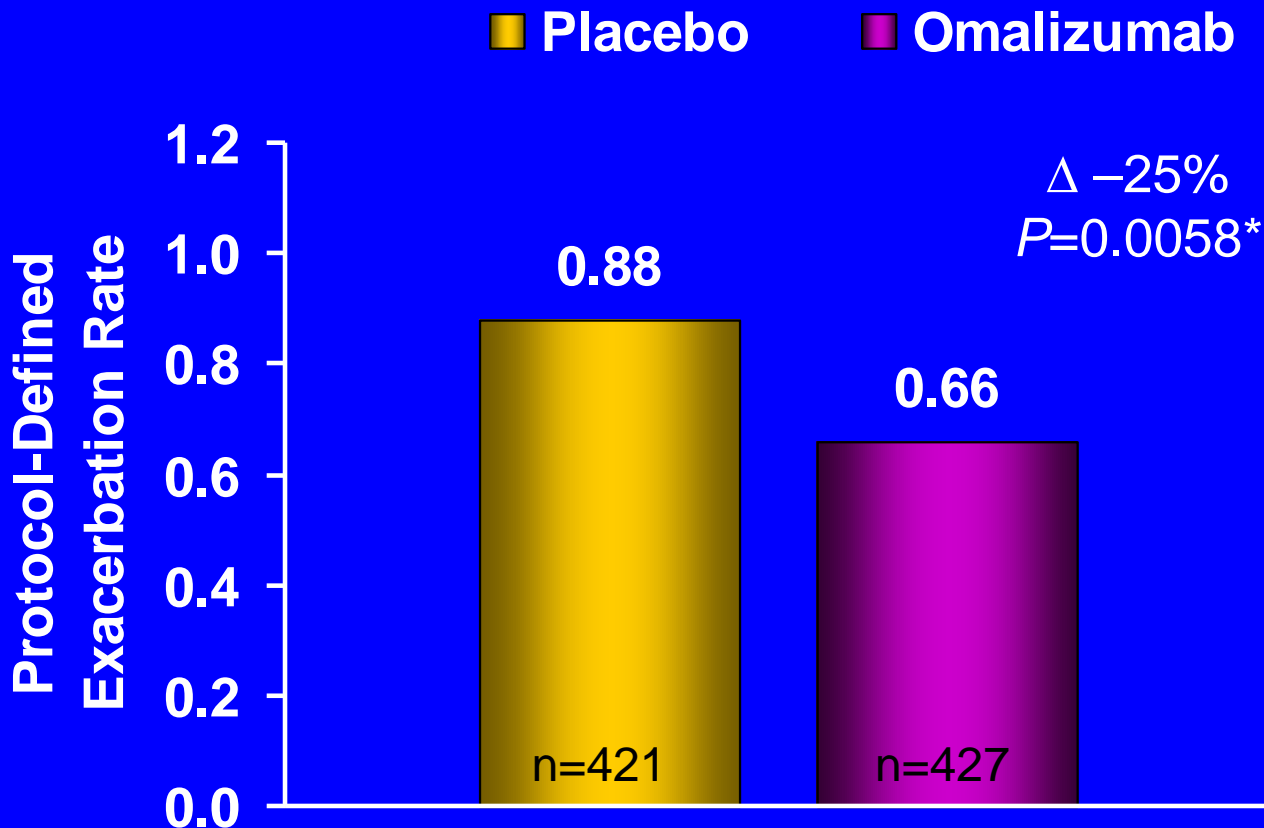

Figure 3. Primary and Secondary Outcomes.

Shown are the mean differences among patients receiving tiotropium, those receiving double-glucocorticoid, and those receiving salmeterol with respect to the morning peak expiratory flow (PEF) (Panel A), the evening PEF (Panel B), the prebronchodilator forced expiratory volume in 1 second (FEV₁) (Panel C), and the proportion of asthma-control days per 14-day period (Panel D). The I bars indicate 95% confidence intervals.

Increased exacerbations in the beclo group
 NEJM 363;18;1715 Decrease response to albuterol in the salmeterol group

Primary Endpoint: Rate of Asthma Exacerbations Over 48 Weeks

*Poisson regression including terms for treatment, concomitant asthma medication strata, dosing regimen, and number of exacerbations in the prior year.

| Exacerbation rates | | | | | | |
|--------------------|----------------------|-----------------------|-----------------------------|------------------------------|---------------------------|----------------------------|
| | Low FeNO at baseline | High FeNO at baseline | Low eosinophils at baseline | High eosinophils at baseline | Low periostin at baseline | High periostin at baseline |
| Omalizumab | 0.60 | 0.50 | 0.65 | 0.70 | 0.73 | 0.66 |
| Placebo | 0.71 | 1.07 | 0.72 | 1.03 | 0.72 | 0.93 |

Wechsler ME et al. Bronchial thermoplasty: Long-term safety and effectiveness in patients with severe persistent asthma. J Allergy Clin Immunol 2013;132:1295-302.

- 5 year follow-up of patients in AIRE2 Trial (Asthma Intervention Research 2)
- Double-blind, sham-controlled, randomized trial of BT
 - 32% reduction in exacerbations
 - 84% reduction in ED visits
 - 66% reduction in time lost from work

Wechsler et al. J Allergy Clin Immunol 2013; 132:1295-302.

Wechsler et al. *J Allergy Clin Immunol* 2013; 132:1295-302.

Other new developments that have been published since the guidelines have been published:

- Montelukast is not as effective as ICS, but compliance is better and for this reason over many years the benefits may be equal to ICS (NEJM)
- Montelukast is not as effective as adding LABA to ICS, but due to better compliance over many years the benefits may be equal to adding LABA to ICS (NEJM)
- Aerobic exercise is effective in reducing asthma symptoms
- Vitamin D deficiency is common in asthma and replacement may decrease steroid resistance.
- Adding macrolides may not be of significant benefit in most asthma patients

Assessing Asthma Control: “Rules of Two”

- If the answer to following questions is yes, a long term controller may be needed or you need to increase care
 - Do you take your quick relief inhaler more than TWO TIMES A WEEK?
 - Do you awaken at night with asthma more than TWO TIMES A MONTH?
 - Do you have daytime symptoms more than twice a week?
 - Do you have attacks more than twice a year
 - OR is there any limitation on exercise or QOL

Summary: what is stressed in the guidelines

- Severity classification on first visit.
- Asthma control on subsequent visits.
- Different guidelines for ages 0 to 4, 5 to 12 and greater than 12.
- Addition of functional ability and exacerbations to both severity and control.
- Stresses that ICS are the drug of first choice.
- Addition of omalizumab or mepolizumab for severe uncontrolled asthma.
- Addition of zileutin for moderate asthma.
- Increase importance of prednisone for severe asthma and very poorly controlled asthma

Thank you and enjoy your day.
