ACC/AATS/AHA/ASE/ASNC/SCAI/SCCT/STS 2017 Appropriate Use Criteria for Coronary Revascularization in Patients With Stable Ischemic Heart Disease

2014 ACC/AHA/AATS/PCNA/SCAI/STS Focused Update of the Guideline for the Diagnosis and Management of Patients With Stable Ischemic Heart Disease

2018 review
OBJECTIVES: 9 IMPORTANT THINGS TO KNOW SIHD

1. Patient presents with history of negative stress test but clinical suspicion of CAD: cath II B
2. Patient has intermediate risk unable to do non invasive testing cath II B

3. FFR from FAME I and II is superior to angiographic visual assessment
4. IV infusion of EDTA now is Class II B (recent trial found to reduce CV events)

5. Enhanced external counter pulsation (EECP) for relief of refractory angina II B
   • Contraindicated in decompensated HF, PAD or severe aortic regurgitation
6. Heart team approach for revascularization in diabetes / complex patients

7. Left mains heart team pci/CABG
8. CABG with LIMA if DM / complex mv dx first class 1 survival benefit not pci
   • FREEDOM trial in DM primary EP in all sections better
     • Death, non fatal MI/stroke p<0.005
     • 5 year rates
       • PCI-26.6%
       • CABG-18.7% Primary endpoint events
Revascularization to Improve Survival Compared With Medical Therapy

#### IIa—For SIHD when both of the following are present:
- Anatomic conditions associated with a low risk of PCI procedural complications and a high likelihood of good long-term outcome (e.g., a low SYNTAX score of ≤22, ostial or trunk left main CAD)
- Clinical characteristics that predict a significantly increased risk of adverse surgical outcomes (e.g., STS-predicted risk of operative mortality ≥5%)

#### IIb—For SIHD when both of the following are present:
- Anatomic conditions associated with a low to intermediate risk of PCI procedural complications and an intermediate to high likelihood of good long-term outcome (e.g., low-intermediate SYNTAX score of <33, bifurcation left main CAD)
- Clinical characteristics that predict an increased risk of adverse surgical outcomes (e.g., moderate–severe COPD, disability from prior stroke, or prior cardiac surgery; STS-predicted operative mortality >2%)

#### III—Harm—For SIHD in patients (versus performing CABG) with unfavorable anatomy for PCI and who are good candidates for CABG

Unprotected left main=UPLM
SYNTAX SCORE II 4-year mortality

- Age (years)
- CrCl (ml/min)
- LVEF (%)
- Left Main
- Gender (male, female)
- COPD (no, yes)
- PVD (no, yes)
PATIENT PRESENTS WITH STRONG ANGINA HISTORY WITHOUT DIABETES AND ANGIOGRAM FINDING SIGNIFICANT COMPLEX 3 VESSEL DISEASE AND SYNTAX SCORE >22

1. Patient has class 1 indication for CABG
2. Patient has equal indication for PCI or CABG without LM or proximal LAD
3. Patient should have global risk reduction and managed medically
4. Patient has a class II A indication for PCI
5. Patient has class II B for CABG

Primary outcome measure was a composite of death from any cause, nonfatal myocardial infarction, or nonfatal stroke

Diabetes and multivessel coronary artery disease to undergo either PCI with drug-eluting stents or CABG

A Primary Outcome

P=0.005 by log-rank test
5-Yr event rate: 26.6% vs. 18.7%
FFR VS. ANGIOGRAPHY FOR MULTIVESSEL EVALUATION

FAME
2 YEAR FOLLOW-UP

PCI performed on indicated lesions only if FFR ≤ 0.80

Randomized

PCI performed on indicated lesions

Primary Endpoint

Composite of death, MI and repeat revasc. (MACE) at 1 year

Key Secondary Endpoints

Individual rates of death, MI, and repeat revasc., MACE, and functional status at 2 years

FFR-Guided

Angio-Guided

730 days

4.5%

Survival Free from Major Adverse Cardiovascular Events

Distal Coronary Pressure (Pd)

Proximal Coronary Pressure (Pa)

(During Maximum Hyperemia)
2014 ACC/AHA/AATS/PCNA/SCAI/STS Focused Update of the Guideline for the Diagnosis and Management of Patients With Stable Ischemic Heart Disease

2.3 Invasive Testing for Diagnosis of Coronary Artery Disease in Patients With Suspected SIHD: Recommendations (New Section)

See Online Data Supplement 1 for additional information.

Class I

1. Coronary angiography is useful in patients with presumed SIHD who have unacceptable ischemic symptoms despite GDMT and who are amenable to, and candidates for, coronary revascularization. (Level of Evidence: C)

Class IIa

1. Coronary angiography is reasonable to define the extent and severity of coronary artery disease (CAD) in patients with suspected SIHD whose clinical characteristics and results of noninvasive testing (exclusive of stress testing) indicate a high likelihood of severe IHD and who are amenable to, and candidates for, coronary revascularization. \(^7-12\) (Level of Evidence: C)

2. Coronary angiography is reasonable in patients with suspected symptomatic SIHD who cannot undergo diagnostic stress testing, or have indeterminate or nondiagnostic stress tests, when there is a high likelihood that the findings will result in important changes to therapy. (Level of Evidence: C)

No class 3

</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2. CABG is generally recommended in preference to PCI to improve survival in patients with diabetes mellitus and multivessel CAD for which revascularization is likely to improve survival (3-vessel CAD or complex 2-vessel CAD involving the proximal LAD), particularly if a LIMA graft can be anastomosed to the LAD artery, provided the patient is a good candidate for surgery. [56-66] (Level of Evidence: B)</td>
<td>Modifed recommendation (Class of Recommendation changed from IIa to I, wording modified, additional RCT added).</td>
<td></td>
</tr>
</tbody>
</table>

CABG indicates coronary artery bypass graft; CAD, coronary artery disease; LAD, left anterior descending; LIMA, left internal mammary artery; PCI, percutaneous coronary intervention; and RCT, randomized controlled trial.

No trial has suggested a survival advantage of PCI for symptom relief........
